

ENGG1050 Assessment 2: Engineering Reflection Report

Weighting: 25%

Word count: 1300–1500 words (excluding references and AI use log)

Format: 12pt font, 1.5-line spacing, Times New Roman

Purpose: Reflective writing is a core professional practice in engineering. This task asks you to look back on your project experience and analyse what happened, why it happened, and what it means for how you work and grow as an engineer. The goal is to examine your thinking, decisions, and development, and not to describe or summarise what your team did.

REMEMBER we recommend using the STAR (situation, task, action, and result) follow by the Atkins and Murphy Model of reflection.

Task: Write a structured reflection report on your engineering project. Your report must address all five sections.

This is an AI Open assessment. See the AI use section below for expectations.

AI use expectations: This assessment is *AI Open*, meaning you may use AI tools (such as ChatGPT or similar) to support your work. However, AI use must be purposeful, critically engaged, and transparent.

What this means in practice: You are expected to use AI as a thinking tool, not a writing replacement. This might include using AI to help you organise your ideas, generate prompts for reflection, draft sections for you to revise, or give feedback on your writing. What matters is that the final reflection represents your genuine thinking and that you can account for how AI shaped (or didn't shape) your work.

AI use log (not included in word count): At the end of your submission, include a brief AI use log (approximately 150–200 words) that addresses:

- Which AI tool(s) you used and at what stage(s) of the task
- What you asked the AI to do and what it produced
- What you accepted, changed, or rejected — and why
- What using AI in this way revealed about your own thinking or writing process

If you did not use AI, briefly explain why not. This is a valid choice and will not affect your mark.

Note: Your AI use log will be assessed as part of the AI use and critical reflection criterion (see rubric). Submitting an incomplete or superficial log or failing to disclose AI use that is evident in your work, will affect your mark for that criterion.

Writing expectations: Write in paragraphs throughout. Do not use dot points or headings within sections in your final submission. Use clear, professional language appropriate for an engineering context.

TASK INSTRUCTIONS

Write a structured reflection report on your engineering project. **Your report must address all five sections below.**

Structure and prompts

1. Introduction (approx. 150 words)

Briefly introduce the project, your role, and what this reflection will focus on.

2. Team dynamics and contribution (approx. 300 words)

Reflect critically on how your team functioned and your role within it. Consider:

- How effective was communication and collaboration within your team, and why?
- What was your specific contribution, and how did it affect the team's performance?
- What would you do differently in a future team situation, and why?

Use a specific example to ground your reflection.

3. Engineering design process (approx. 300 words)

Analyse how your design thinking evolved across the project. Consider:

- How did testing, feedback, or analysis change your approach?
- Why did you make the design decisions you made, and what were the trade-offs?
- How did your final design differ from your initial approach, and what does that tell you about your design process?

4. Challenges, constraints, and problem-solving (approx. 300 words)

Examine the key challenges you faced and how you responded. Consider:

- What were the most significant constraints on your project, and how did they shape your decisions?
- What problem-solving strategies did you use, and how effective were they?
- What did the experience of working through these challenges teach you?

5. Personal learning and professional development (approx. 300 words)

Reflect on your growth as an engineering student. Consider:

- What has this project changed or reinforced in how you understand engineering practice?
- Where did you fall short of your own expectations, and what does that tell you?
- How will this experience influence how you approach future projects?

6. Conclusion (approx. 150 words)

Summarise your key takeaways and what they mean for your development as an engineer.

NOTE: Please make sure to check the marking rubrics for this assessment.

Alignment to unit learning outcomes

Section	ULO
Team dynamics and contribution	ULO 3
Engineering design process	ULO 1, ULO 2
Challenges, constraints, and problem-solving	ULO 1, ULO 2
Personal learning and professional development	ULO 5
AI use and critical reflection	ULO 4, ULO 5
